PowerSync™ Analyzer News

Volume I

November, 2006

Welcome to the first edition of the Sifos Technologies Power over Ethernet test & measurement solutions newsletter. We are excited to announce the soon to be released PowerSync Analyzer Multi-Port Performance Test Suite software upgrade and the Powered Device Analyzer!

PowerSync Analyzer, Multi-Port Performance Test Suite

The **Multi- Port Performance Test Suite (MPTS)** takes the **PowerSync Analyzer (PSA)** and its proven PSE Conformance Test Capabilities into the realm of fully automated PSE System Power Management, Capacity Analysis, and Multi-Port Timing and Interaction testing. This highly unique capability enables product developers and QA professionals to gain totally new insights into PoE system characteristics and behaviors. Users are given total control of many key Powered Device emulation characteristics throughout the execution of the MPTS. The MPTS will be available starting with **PSA Software Release 3.0** for the PowerSync Analyzer product line.

PoE Powered Device Analyzer

The **PowerSync PDA-100** is a one-box solution for high-coverage testing and analysis of **PoE Powered Devices (PD)**. It provides go/no-go automated sequences covering PD detection, classification, power-up, and power-down characteristics with built in limits for **802.3af compliance** and PD classification integrity verification. It also offers real-time monitoring of PD power consumption across the full range of input voltages.

Users may create customized test sequences and associated pass-fail limits to support specialized test objectives.

Thank you for your interest in Sifos Technologies' Power over Ethernet Test & Measurement Solutions!

David Lucia, President
